

VIDEO SCRIPT — DRUM-OCE | EIC Accelerator 2026

Max 3:00 min | Speak slowly, look at the camera | Times = when each part STARTS

0:00

Hello, my name is Dimitri Hristov — individual applicant, PIC 861168814. My project is DRUM: an open-source, photo-verified carbon removal and environmental evidence ledger.

0:20

Today, carbon removal claims are trusted, not proven. Buyers, regulators and insurers cannot independently verify what a credit says — MRV reports are opaque PDFs that are not tamper-evident. Fraud and over-claiming have destroyed confidence in voluntary carbon markets. And from 2027, under the EU CRCF Regulation, compliant evidence must be third-party verified.

0:50

DRUM turns every removal claim into a verifiable evidence object. Each claim becomes an evidence certificate anchored to Bitcoin and EVM blockchains — append-only, tamper-evident. Anyone can re-verify every proof end-to-end, because the core is fully open source. Incumbents sell dashboards. We sell proofs.

1:25

The market is switching on: 1 to 2 billion dollars today, IMF-cited 5 to 10 billion by 2030. The MRV market alone is 1.5 to 2 billion dollars — and every credit carries it as a cost line.

1:50

We are already live: 20,339 verification checks served, 58 countries, 416 organizations, 458 developers — with zero marketing spend. We are routed through MCP and AI registry directories, embedded directly into developer workflows.

2:10

I am the founder, with over 30 years in software engineering, and I built the complete DRUM stack solo. In year one I close the gaps: an MRV certification advisor, an embedded engineer, and at least 40 percent women among the first four hires.

2:35

I am asking the EIC for 2.5 million euros in grant funding — because, pre-revenue and pre-incorporation, no market actor will fund the full amount yet. The grant funds 24 months to TRL 9, and a credible seed round after it. Vision: the default evidence layer for every carbon removal claim worldwide. Don't trust — verify. Thank you.
